C; Species: Equus caballus (domestic horse)
C; Species: Equus caballus (domestic horse)
C; Accession: S02302
R; von Bahr-Lindstroem, H.; Hempel, J.; Joernvall, H.
Eur. J. Biochem. 141, 37-42, 1984
A; Title: The cytoplasmic isoenzyme of horse liver aldehyde dehydrogenase. Relationship the Reference number: S02302; MUID:84208025; PMID:6723662
A; Accession: S02302
A; Molecule type: protein
A; Pesidues in the regions 1-16 and 443-475 were positioned by homology with the huck complex: homotetramer
C; Function:
A; Description: catalyzes the oxidation of an aldehyde doby in diverse metabolic pathways in various
C; Superfamily: aldehyde dehydrogenase (NAD+); aldehyde dehydrogenase homology
C; Reywords. acetylated amino end, alcohol metabolism; cytosol; homotetramer; liver; NAD;
F; B; 322, Domain: aldehyde dehydrogenase homology ALDD;
F; 1/Modified site: blocked amino end (Ser) (probably acetylated) #status experimental
F; 268, 302/Active site: Glu, Cys #status predicted
F; 455/Binding site: NAD (Cys) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

PATHWAY: Ethanol utilization; second step.
SUBGUNIT: HOMOTETRAMER (BY SIMILARITY).
SUPCELLULATE LOCATION - Mitrodondrial matrix.
INDUCTION. By refinoic acid: 4-5 told increase.
SIMILARITY: RELONGS TO THE ALDEHYDE DEHYDROGENASES FAMILY.

-!- PATHWAY: Ethanol utilization; second step.
-!- SUBONIT: HOMOFETRAMER (HY SIMILARITY).
-!- SUBCELLULAR LOCATION: Mitochondial matrix.
-!- TISSUE SPECIFICITY: LITERIE AND IN A LESSER EXTENT IN BRAIN.
-!- SIMILARITY: BELONGS TO THE ALDEHYDE DEHYDROGENASES FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACCORDING A LOSS TABLES FLANT AND A MAJOR ROLE IN THE DETOXIED OF ACCOUNT A LOSSING A CETALDERIVED. THEY ARE INVOLVED IN THE METABOLISM OF CORTICOSTEROIDS, HIOGENIC AMINES, NEUROPEANSMITTERS, AND LIPID

3-Hydroxypropionic acid preparation, for use e.g. as monomer, by fermenting recombinant microorganisms expressing genes for suitable enzymes in the presence of alycerol or glucose -
```

Claim 5; Page 39-41; 63pp; English.

The present invention describes a method for the production of 3-hydroxpropionic acid (3-HP). The method comprises fermenting recombinant microcranism in the presence of a source of glycerol (1) or glucose, where the microorganism: (i) expresses genes for non-native enzymes which catalyse the production of (3-HP) from (1), (ii) arries genetic constructions for the expression of a glycerol dehydratase (GDHT) and aldehyde dehydrogenase (ADH) capable of catalysing the production of (3-HP) from (1), or (11) carries a genetic construct man ADH capable of catalysing the production of (3-HP) from (1), 3-HP is a monomer, and is useful e.g. in the production of absorbable prosthetic devices and surgical sutures or for incorporation into beta-laciams, production of acrylic acid or formation of tifiluromethy; atch alcohols or diols, polyhydroxyalkonares and copolymers with lactic acid.

Incorporation of genes encoding two enzymes makes the host organisms able to produce (3-HP) from (1). The biotechnological method of present sequence represents the E coli aldehyde dehydrogenase aldA, which is used in the exemplification of the present invention.

```
The invention relates to a method of identifying compounds that modulate a newly iscutified mar regulated (NIMK) pelypetide artivity. The method comprises contacting an NIMK polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulate the activity or expression of the polypeptide, and selecting the modulaters. NIMK nucleic acids and polypeptides are used in the treatment of microbial infections, and in sereening for modulators of NIMK expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virtience of a microbe in a subject suffering from an infection. AAU29.429.AAU29.479 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

Pseudomonas putida. This catalyses reactions such as the NAD+ dependent oxidation of hydroxypyruvaldehyde to hydroxypyruvic acid and reacts specifically with 2-oxidachydes is the hydroxypyruvic acid and reacts specifically with 2-oxidachydes is the sydroxypyruvic acid and reacts of provident in the protein was initially purified from a culture of P putida, and subjected to tryptic cleavage the Iraqments thus obtained were sequenced, and the sequence information used to design primers AAAUUMS-AUTHOR. These was a sequenced, and the sequence information of a full-length NNA euchding ald-hyde dehydrogenase in a determining the full-length NNA euchding ald-hyde dehydrogenase in a genomic library. This was amplified using primers AAAUUMS-AUTHR, and inserted into a vector for transformation of cells. Perombinantly produced Pseudomonas putida ald-hyde dehydrogenase may be used for the synthesis of serine or cysteine from although and such in a vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             190 KIVPELGI PROVENLVI GROPTVOQELAGNEKVAMVSMTGSVSAGEKIMATAAKNI TKVG 249
